1. You will probably want to remove the brake handle shaft from the car before attempting to replace the handle.

2. Drive the pin further into the shaft. The pin is slightly shorter than the diameter of the shaft, so it will move further into the shaft, allowing you to slide the brake handle off of the shaft.

3. After removing the handle, drive the pin all the way through the shaft. Set it aside.

4. Slide the new handle onto the shaft, lining up the hole in the handle with the hole in the shaft.

5. Drive your original pin into the hole until it is flush with the outside surface of the handle.
